[23918](#) [Health Heart Diet](#) [Answer](#)

Question ID The question: I understand that there is a diet that will remove arterial deposits. Is this correct? If correct, where can I get a copy of the diet? Background: I just...

[83614](#) [Prednisone Decrease Causing Severe Chills](#) [Answer](#)

I have taken prednisone for 27 years. Usually around 10-15 mg per day but up to 35mg as needed when stressed, as my Crohn's gastro doctor is aware. I began remicade three years...

[15560](#) [Medication and fluctuating bp](#) [Answer](#)

I'm a female, 47 and overweight taking small doses of prozac and elavil for fibromyalgia and am on HRT. My dr is watching my bp- my diastolic reading and pulse rise to over 100...

Query	
What color is the grass?	
Responses	
Tomorrow is Saturday	1
The grass is green	3
The capital of Canada is Ottawa	2
The sky is blue	2
A whale is a mammal	1

Sparse Vectors

Keyword-based search in the context of hybrid search often uses a representation called sparse embeddings, which is why it is also referred to as sparse vector search. Sparse embeddings are vectors with mostly zero values with only a few non-zero values, as shown below.

Sparse Vectors

Hello world, hello everyone

let's say hello to the world with our new project

let's

say

hello

to

the

world

with

our

new

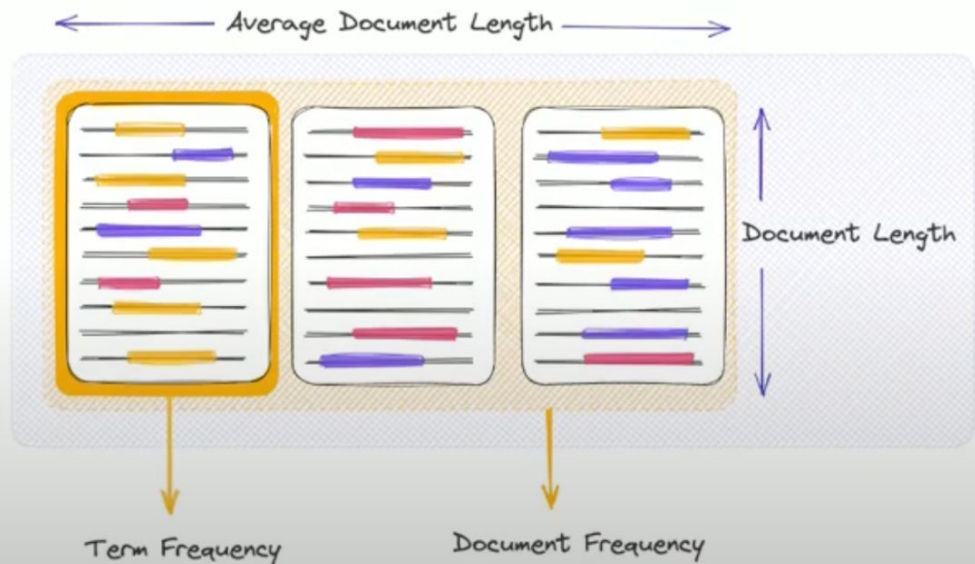

project

TF-IDF

BM-25

TF-IDF

Search: Apple

TF Calculation:

$$TF(\text{"Apple"}, d1) = 1/5 = 0.2$$

$$TF(\text{"Apple"}, d2) = 0/5 = 0$$

$$TF(\text{"Apple"}, d3) = 1/6 = 0.167$$

TF-IDF

Term Frequency - Inverse Document Frequency

IDF Calculation:

$$IDF(\text{"Apple"}) = \log(3/2) = 0.4054651081081644$$

TF-IDF Calculation

$$TF-IDF(\text{"Apple"}, d1) = 0.405 * 0.2 = 0.081 \text{ (approx)}$$

$$TF-IDF(\text{"Apple"}, d2) = 0.405 * 0 = 0$$

$$TF-IDF(\text{"Apple"}, d3) = 0.405 * 0.167 = 0.068$$

Result: The word apple has more relevant to Document 1

BM-25

BM-25 (Best Match)

Document Length Normalization and non-linear term frequency scaling (saturation)

Given a query Q , containing keywords q_1, \dots, q_n , the BM25 score of a document D is:

$$\text{score}(D, Q) = \sum_{i=1}^n \text{IDF}(q_i) \cdot \frac{f(q_i, D) \cdot (k_1 + 1)}{f(q_i, D) + k_1 \cdot \left(1 - b + b \cdot \frac{|D|}{\text{avgdl}}\right)}$$

where $f(q_i, D)$ is q_i 's **term frequency** in the document D , $|D|$ is the length of the document D in words, and avgdl is the average document length in the text collection from which documents are drawn. k_1 and b are free parameters, usually chosen, in absence of an advanced optimization, as $k_1 \in [1.2, 2.0]$ and $b = 0.75$.^[1] $\text{IDF}(q_i)$ is the IDF (**inverse document frequency**) weight of the query term q_i . It is usually computed as:

$$\text{IDF}(q_i) = \ln \left(\frac{N - n(q_i) + 0.5}{n(q_i) + 0.5} + 1 \right)$$

where N is the total number of documents in the collection, and $n(q_i)$ is the number of documents containing q_i .

BM-25

BM-25 (Best Match)

$$IDF = \log \left[\frac{N - n(t) + 0.5}{n(t) + 0.5} + 1 \right]$$

IDF calculation

Total Number of documents in the corpus = 3,

$n(\text{Apple}) = 2$

$$IDF(\text{Apple}) = \log \left(\frac{(3-2+0.5)}{(2+0.5)} + 1 \right) = 0.47$$

TF calculation

$$TF(\text{Apple}, d1) = 1/5 = 0.2$$

$$TF(\text{Apple}, d2) = 0/5 = 0$$

$$TF(\text{Apple}, d3) = 1/6 = 0.167$$

BM-25 Calculation

k_1 and b are parameters that control the influence of TF and document length.

Common values are
 $k_1 = 1.5$ and $b = 0.75$.

$$\text{score}(D, t) = IDF(t) * \frac{TF(t, D) * (k_1 + 1)}{TF(t, D) + k_1 * \left[1 - b + b * \frac{|D|}{\text{avgdl}} \right]}$$

$$\text{score}(d1, \text{Apple}) = 0.470$$

$$\text{score}(d2, \text{Apple}) = 0$$

$$\text{score}(d3, \text{Apple}) = 0.470$$

The formula effectively balances the frequency of the term in the document against the frequency of the term in the entire corpus, adjusted for document length,

Key Takeaway

Memory Efficiency: They use less memory due to high proportion of zeros.

Interpretability: Dimensions often correspond directly to specific features, enhancing transparency.

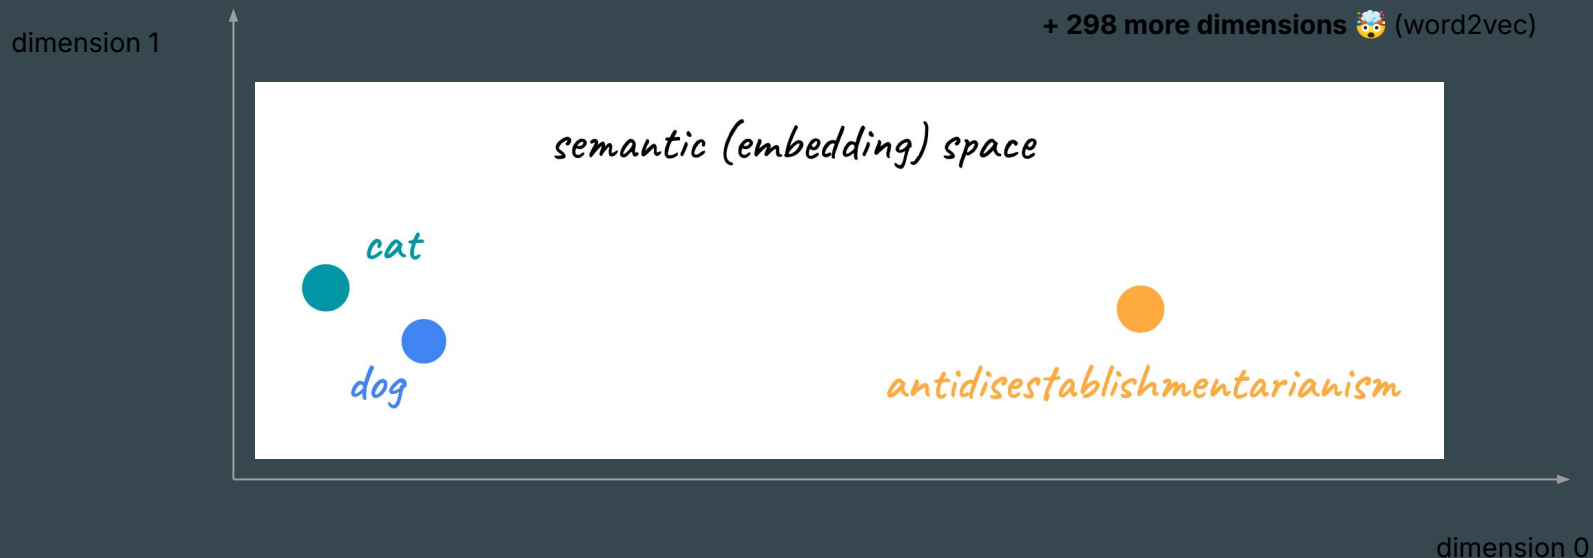

High Dimensionality: May result in computational challenges and inefficiencies.

Difficulty in Capturing Complexity: Sparse nature can make it hard to represent complex patterns effectively.

Embeddings

A list (vector) of numbers [0.5, 0.798, 0.03, ...]

Similar things are close together

Semantic algebra with embeddings

Kinda handy, like we might do with vectors

Semantic search

sparse

$[0, 0, 0, 1, 0, \dots 0]$

dense

$[0.2, 0.7, 0.1, 0.8, 0.1, \dots 0.9]$

Dense Vectors

Measuring similarity with cosine

Cosine similarity puns are sticky

Semantle - a game of semantic

Semantle

Stats

Rules

Settings

Today is puzzle number **494**. The nearest word has a similarity of **83.89**, the tenth-nearest has a similarity of 45.49 and the one thousandth nearest word has a similarity of 19.85.

Guess

#	Guess	Similarity	Getting close?
7	vegetable	0.49	(cold)
1	carrot	8.81	(cold)
3	ethics	8.78	(cold)
6	embedding	5.83	(cold)
4	running	3.66	(cold)
2	horse	1.47	(cold)
5	safety	0.07	(cold)

Hint

Give up

Dense Retrieval is also not perfect

Multimodal Embedding

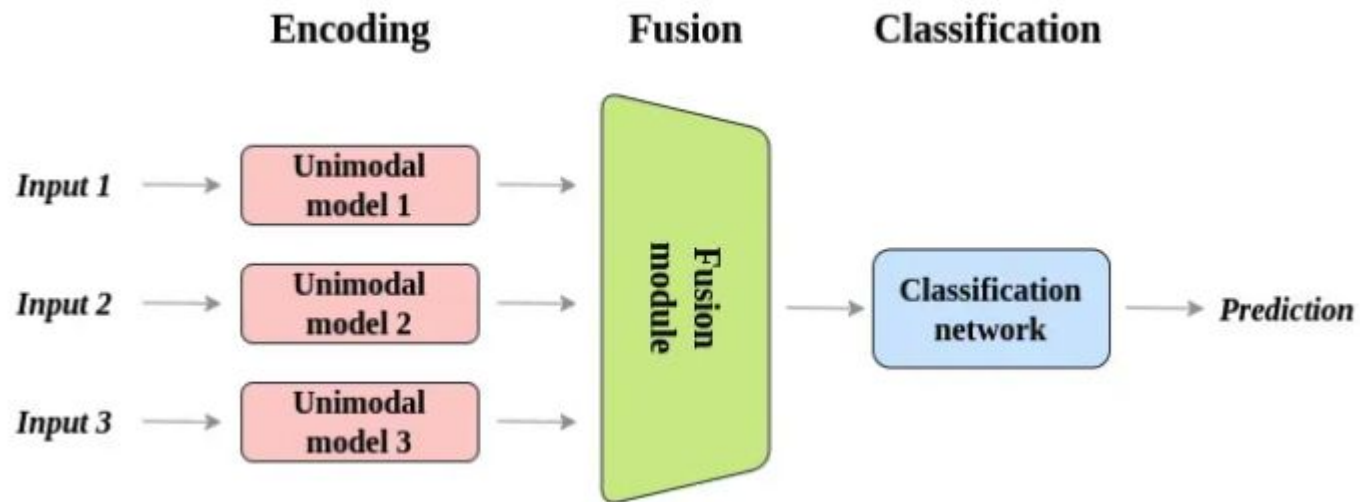

Joint Embedding Space

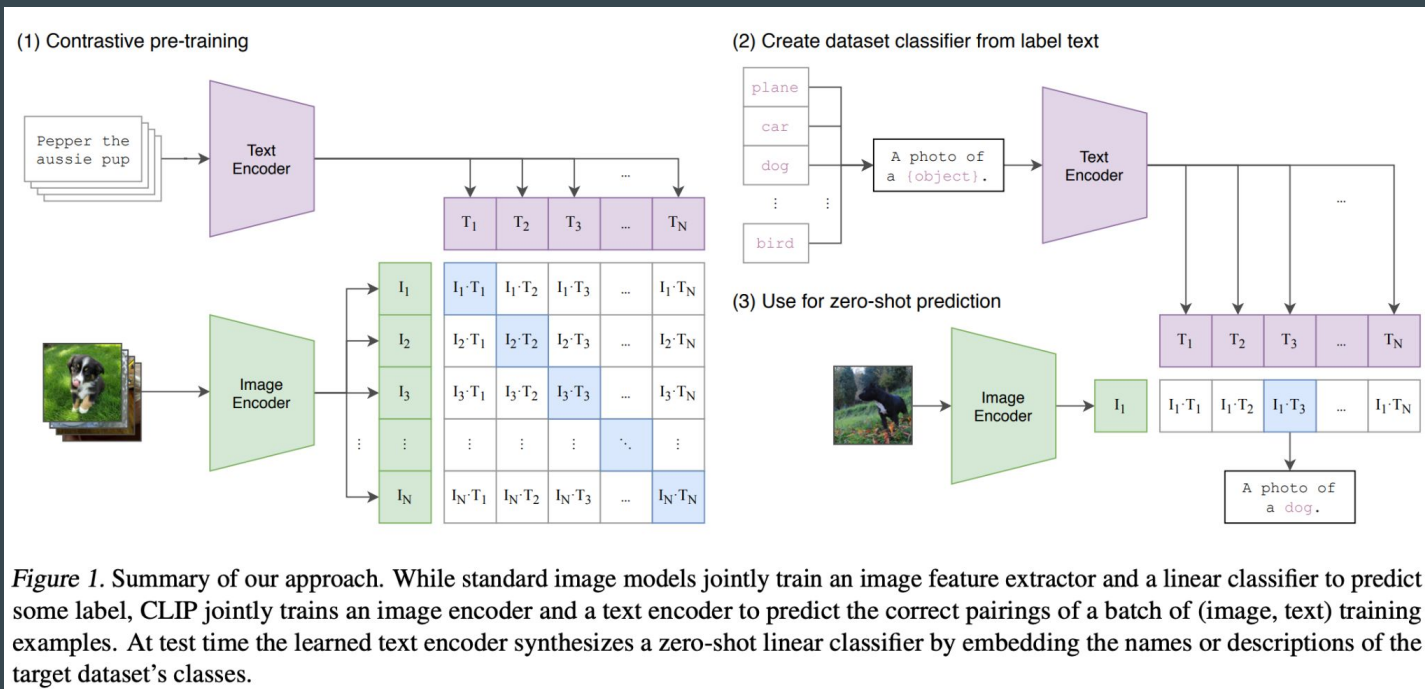

“woodblock print of the Edo period depicting three boats moving through a storm-tossed sea with a large wave forming a spiral in the centre and Mount Fuji visible in the background”

Joint embedding space
(typically a vector space of dimension 512 or 768)

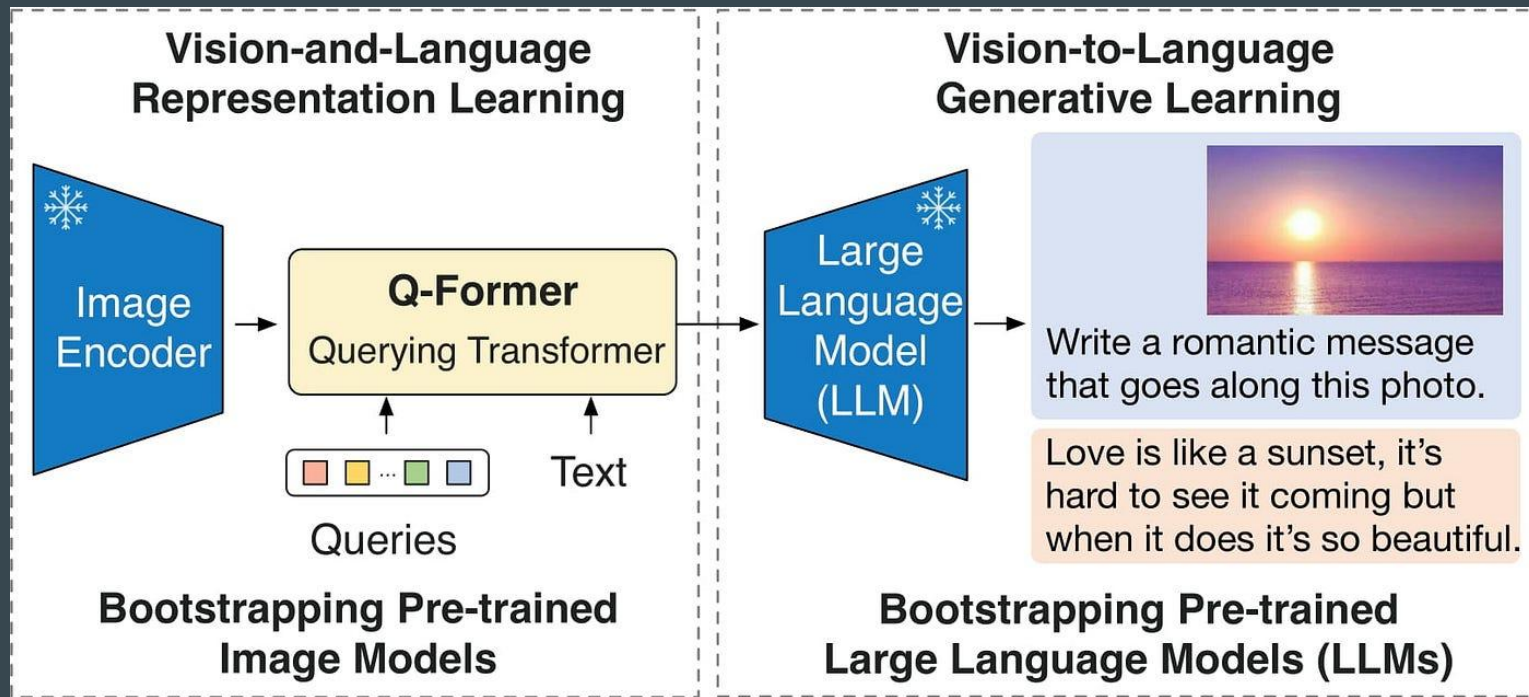

Examples: CLIP, SigLIP etc

MultiModel Search (Using BLIP2 and Lavis)

BLIP-2 Architecture

Demo

Core Components for Conversational Search

- Choosing correct Multimodal Model (like Llava)
- Conversational History Handling

Retrieval-Augmented Generation (RAG)

Using LlamaIndex, Ollama using Llava model

Examples

CLIP embedding and image correlation reasoning using GPT4V

LiaVa Demo with LlamaIndex

Retrieval-Augmented Image Captioning

[Beta] Multi-modal ReAct Agent

Multi-Modal GPT4V Pydantic Program

Multi-Modal RAG using Nomic Embed and Anthropic.

Multi-Modal Retrieval using GPT text embedding and CLIP image embedding for Wikipedia Articles

Multimodal RAG for processing videos using OpenAI GPT4V and LanceDB vectorstore

Multimodal RAG with VideoDB

[Multimodal Ollama Cookbook](#)

Multi-Modal LLM using OpenAI GPT-4V model for image reasoning

Multi-Modal LLM using Replicate LLaVa, Fuyu 8B, MiniGPT4 models for image reasoning

Semi-structured Image Retrieval

Multimodal Ollama Cookbook

[Open in Colab](#)

This cookbook shows how you can build different multimodal RAG use cases with LLaVa on Ollama.

- Structured Data Extraction from Images
- Retrieval-Augmented Image Captioning
- Multi-modal RAG

Setup Model

```
pip install llama-index-multi-modal-llms-ollama
pip install llama-index-readers-file
pip install unstructured
pip install llama-index-embeddings-huggingface
pip install llama-index-vector-stores-qdrant
pip install llama-index-embeddings-clip
```

```
from llama_index.multi_modal_llms.ollama import OllamaMultiModal
```

```
mm_model = OllamaMultiModal(model="llava:13b")
```
